

Choose Your Battles

How To Fight The Right Wars

Eyal Paz, Security Researcher

Check Point®
SOFTWARE TECHNOLOGIES LTD.

28 th ANNUAL
FIRST
CONFERENCE **SEOUL**
JUNE 12 - 17, 2016

whoami

- Security Researcher at Check Point
- B.Sc. in Software Engineering, studying towards M.Sc. in Computer Science
- Information Security lecturer
- Father

Check Point®
SOFTWARE TECHNOLOGIES LTD.

Agenda

- Research Motivation & Goals
- Under The Hood - Algorithmic Overview
 - Aggregating events to incidents
 - Differentiating incidents on host
 - In-house TI feed
 - Threat context

Check Point
SOFTWARE TECHNOLOGIES LTD.

Motivation

Staying a Step Ahead of Threats

Make every effort to **PREVENT** attacks

Detection is not enough. The only way to avoid the cost of an attack is to prevent it altogether

DETECT and **CONTAIN** attacks as soon as possible

Once infected, the cost of the attack just keeps on rising

Effectively **RESPOND** and **REMEDiate**

Address the real business impact

Make sure the intrusion doesn't come back

Timing is Everything

Source: 2015 cost of data breach study: global analysis, Ponemon Institute

The Longer an attack goes **UNDETECTED**,
the more time it takes to **CONTAIN** it

The longer it takes to **CONTAIN** it,
the more it will **COST**

Loud Infection → Fast Response

CryptoWall

TeslaCrypt

- 1-3 days
- 3-7 days
- 7-14 days
- 14-28 days
- 28+ days

~70% of the infected machines are remediated within a week.

Silent Infection → Slow Response

Dorkbot

Conficker

- 1-3 days
- 3-7 days
- 7-14 days
- 14-28 days
- 28+ days

~60% of the infected machines remediation takes more than a month.

Loud vs. Silent; What is More Severe?

		
Median Response Time	1-3 days	More than 28 days
Attack Vector	Mostly Phishing & Exploit kits	Mostly Phishing & Exploit kits
Attack Type	Data corruption, Denial of Service, Ransom demanding	Espionage, Banking credentials, Data breach
Discovery	Easy	Hard
Damage	Temporal	Continual

Reasons For Slow Response

- Internal bureaucracy and politics
 - Different teams with different agendas need to collaborate
- Network configuration issues
 - Difficult or impossible to track the infected host
- Understaffed security teams
 - “62% of organizations are receiving more alerts than they can feasibly investigate”

Source: 2015 Incident Detection & Response Survey, RAPID7

Threat Context

- Given one or more hosts access a “Malicious site”
- What should the security team do with such information?
- How should it be prioritized vs. other alerts?

URL: <http://settings-yahoo.com/>

Detection ratio: **5 / 67**

Analysis date: 2016-05-16 12:11:55 UTC (0 minutes ago)

Fortinet	Malware site
Kaspersky	Malware site
CLEAN MX	Suspicious site

Research Questions & Directions

- How to choose your battles
 - Aggregate & summarize multiple alerts to a reasonable number of incidents to decrease workload
- How to fight the right war
 - Adding a context layer to incidents to better prioritize their urgency

Algorithmic Overview

Aggregating Events to Incidents

- Discover similarity between compromised hosts
- Reduce overhead of security incidents
- Assist in prioritization & remediation
One script to clean them all

Step 1 – Pre-processing

- Get all alerts from all available sensors' events:
 - FW & IDS
 - End Point
 - Domain Controller
 - Proxy & DNS Servers

Step 2 – Feature Vector

- Create a list of all unique IoC
 - Domains
 - Destination IP for non HTTP/DNS addresses
 - Destination port
 - And any other forensics telemetry type you can get
- Not all features are equally weighted features

Step 3 – Host Matrix

- Create a matrix where the rows are for hosts and the columns are for the features
- Example:
 - 3 hosts – A, B, C
 - 4 IoCs – evil-1.com, evil-2.com, 1.2.3.4, TCP/6667
 - Domain weight is 1, IP weight is 1.3, Port weight is 1.6

	evil-1.com	evil-2.com	1.2.3.4	TCP/6667
Host A	1	1	0	0
Host B	0	0	1.3	1.6
Host C	0	1	1.3	1.6

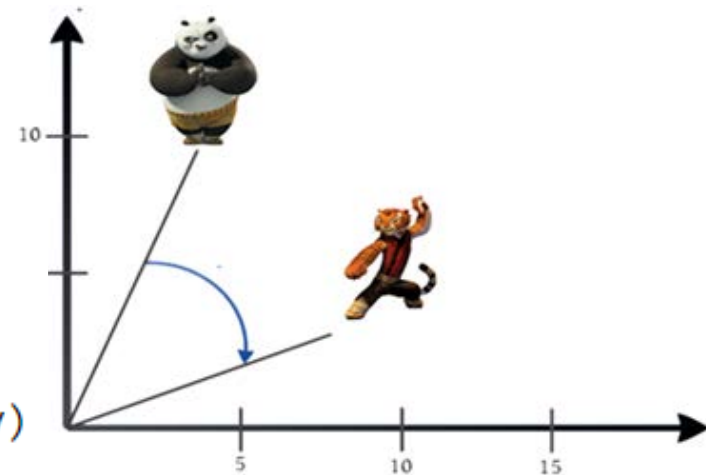

Cosine Similarity

- a measure of similarity between two vectors of an inner product space that measures the cosine of the angle between them – number in range [0,1]

$$\text{similarity} = \cos(\theta) = \frac{\mathbf{A} \cdot \mathbf{B}}{\|\mathbf{A}\| \|\mathbf{B}\|} = \frac{\sum_{i=1}^n A_i B_i}{\sqrt{\sum_{i=1}^n A_i^2} \sqrt{\sum_{i=1}^n B_i^2}}$$

```
def cosine_similarity(x,y):
```

```
    numerator = sum(a*b for a,b in zip(x,y))
    denominator = square_rooted(x)*square_rooted(y)
    return round(numerator/float(denominator),3)
```

Step 4 – Similarity Matrix

- Create the Cosine Similarity matrix when we are comparing every 2 hosts'
- In the below example:
 - Green** is for strong matches
 - Yellow** is for weak matches
 - Red** is for non-matches

	Host A	Host B	Host C
Host A	1	0	0.3
Host B	-	1	0.9
Host C	-	-	1

Step 5 – Noise Reduction

- Mask out weak matches for noise reduction

	Host A	Host B	Host C
Host A	1	0	0
Host B	-	1	0.9
Host C	-	-	1

Step 6 - Extract Incidents

- Create a graph using the similarity matrix as a graph adjacency matrix

- Find the graph connected components which comprise the security incident that we looked for:
 {Host A}, {Host B, Host C}

PoC at Customer sites (24 Hours)

	Organization A	Organization B
Unique Indicators	177	41
Compromised Hosts	29	19
Security Incidents	11 (-62%)	9 (-52%)

Illustration

PoC at Customer sites (24 Hours)

	Organization C	Organization D
Unique Indicators	42	90
Compromised Hosts	35	44
Security Incidents	13 (-62%)	16 (-63%)

Illustration

Model Limitation

- This model has a hidden assumption that all indicators that are found on a given host are related
- We all know that's not always the case

Differentiate Incidents

- To differentiate the incident we need to break it down to its components – indicators
- Define similarity between indicators
- Consider recurring occurrences of the same indicators on different hosts

URL Similarity

- Equal non-zero amount of dashes
- Equal non-zero amount of digits
- Digits/Dash are on the same index
- Subdomains under same domain
- Same exact registrant
- Same anonymized registrant service
- Different anonymized registrant
- Small domain/registrant edit distance
- Same exact domain name
- Same domain name length
- Same IP resolutions amount
- Both domains had never had IP allocated
- Shared ASN
- Shared IP addresses
- Same TLD which is not .com and not local
- Close registration date
- Close first detected date
- Close language ratio
- Shared URL path exactly
- Similar URL path

CryptoWall C2 Servers

- Are the URLs below related?
 - `abelindia.com/1LaXd8.php`
 - `purposenowacademy.com/5_YQDI.php`
 - `mycampusjuice.com/z9r0qh.php`
 - `theGinGod.com/HS0ILJ.php`
 - `yahoosupportaustralia.com/8gX7hN.php`
 - `successafter60.com/iCqjno.php`
 - `alltimefacts.com/EiFSId.php`
- Other than the funny URL path pattern
 - All the above URLs were first seen on 04-Nov-2015 which indicate they belong to the same campaign

Emotet Malware DGA

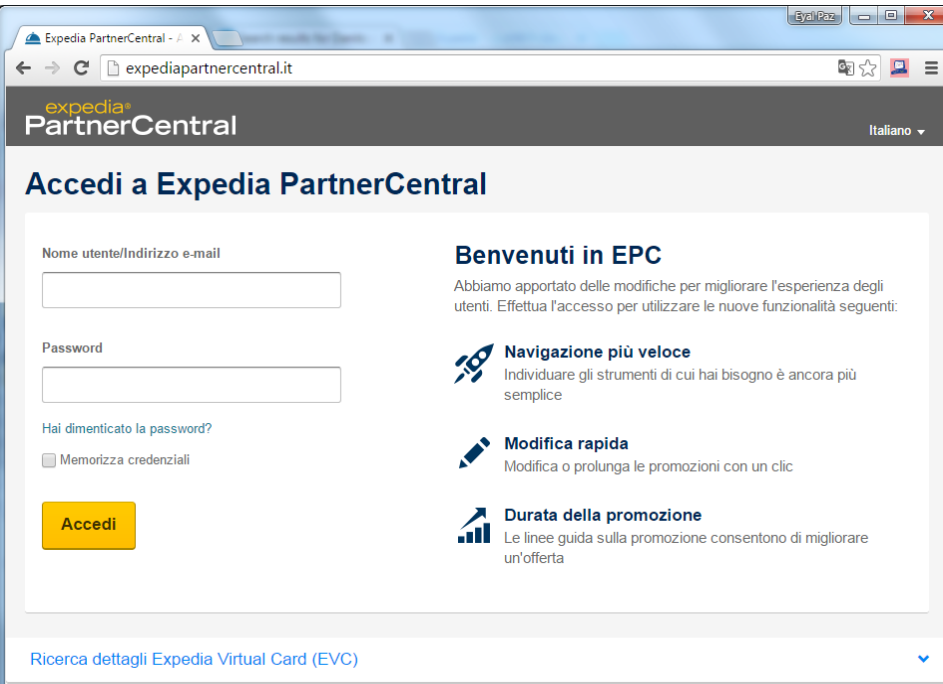

- Are the domains below similar?
 - myjfqirgagnpboou.eu
 - kgpaorkwqlgrfcre.eu
 - pqxhqpvumylnikjh.eu
 - iddxbogywitoaddv.eu
 - clgarxlbvxcraqht.eu
 - ...
- Other than the simple pattern $[a-z]\{16\}\.eu$
 - All domains had never had an IP allocated
 - All domains were never registered
 - Close linguistic ratio
 - Same TLD which is not .com and not local

Virus Total URL - Emotet DGA

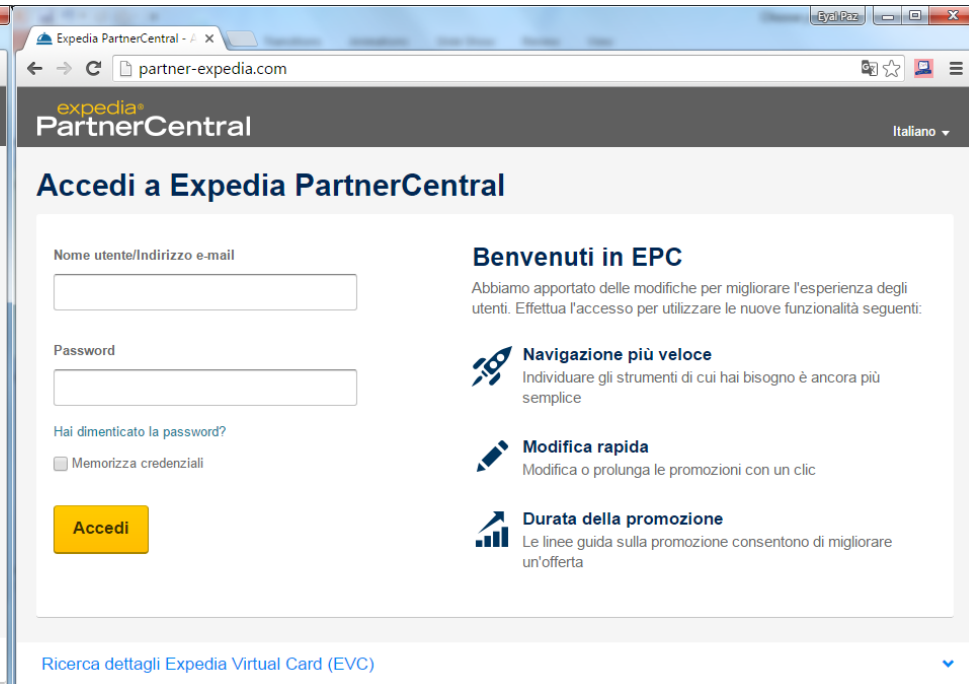

Domain	VT URL Detection*
pqxhqpvumylnikjh.eu	0 / 67
iddxbogywitoaddv.eu	0 / 67
idlueqkbfkkclcdj.eu	0 / 67
jjnstqfppyclvonk.eu	0 / 67
clgarxlbvxcraqht.eu	1 / 67
kgpaorkwqlgrfcre.eu	1 / 66

VT URL - Expedia Phishing Campaign

Domain	VT URL Detection*
accessoclienti-expedia.com	0 / 67
accessoclienti-expedia.it	2 / 67
partner-expedia.com	7 / 67

Step 1 – Pre-processing

- Get all IoC from all available sensors' events:
 - FW & IDS
 - End Point
 - Domain Controller
 - Proxy & DNS Servers

Step 2 – Similarity Graph

$G \leftarrow \text{Init-Graph}()$

For each pair of IoC of same type, do:

$G.\text{Add-Node}(\text{IoC-A})$

$G.\text{Add-Node}(\text{IoC-B})$

If $G.\text{Has-Path}(\text{IoC-A}, \text{IoC-B}) = \text{False}$
AND IoC-A is similar to IoC-B, then:

$G.\text{Add-Edge}(\text{IoC-A}, \text{IoC-B})$

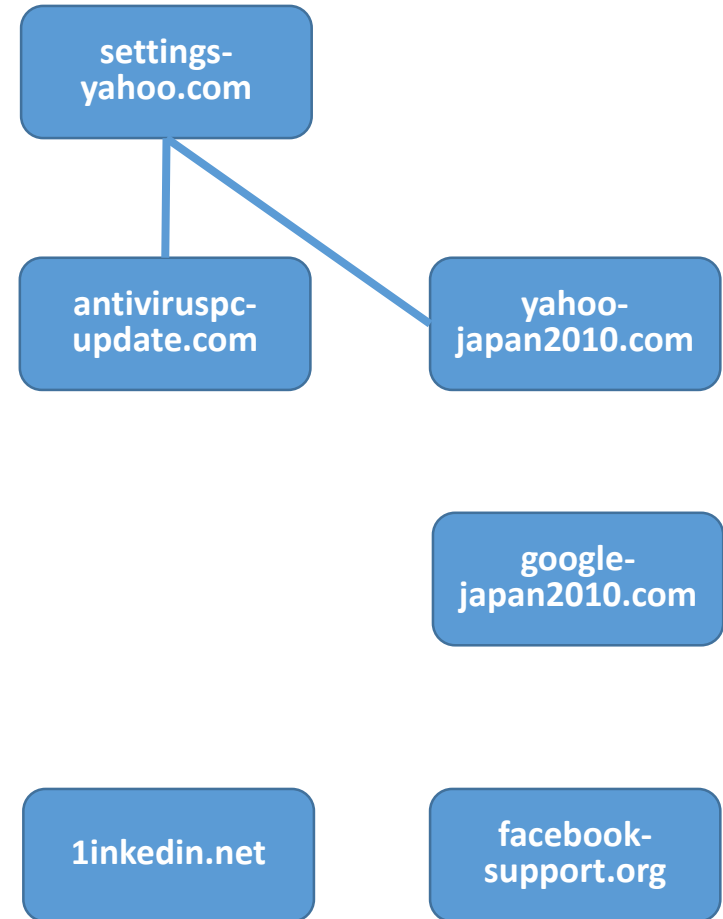

$\text{Incidents} \leftarrow G.\text{Connected-Components}()$

Phishing Actor

- Are the domains below similar?
 - settings-yahoo.com
 - linkedin.net
 - antiviruspcc-update.com
 - google-japan2010.com
 - yahoo-japan2010.com
 - facebook-support.org

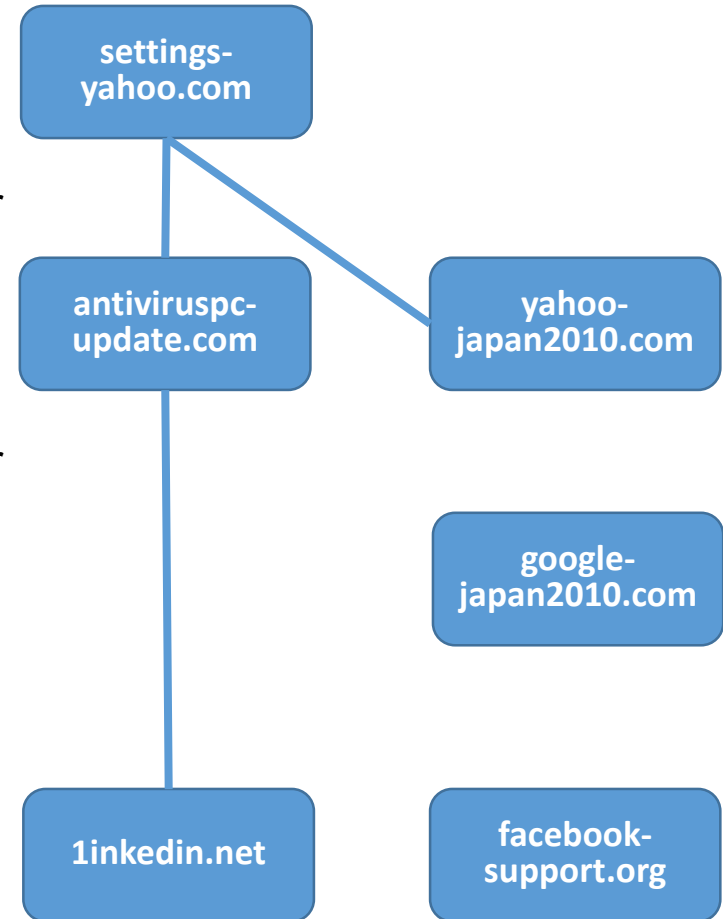

Phishing Actor

- ✗ settings-yahoo.com ↔ 1inkedin.net
 - Same anonymized registrant service provider
- ✓ settings-yahoo.com ↔ antiviruspc-update.com
 - Shared IP addresses
 - Same anonymized registrant service provider
 - Equal non-zero amount of dashes
 - Same IP resolutions amount
- ✗ settings-yahoo.com ↔ google-japan2010.com
 - Same anonymized registrant service provider
 - Equal non-zero amount of dashes
 - Both contain popular domain name
- ✓ settings-yahoo.com ↔ yahoo-japan2010.com
 - Shared IP addresses
 - Same anonymized registrant service provider
 - Equal non-zero amount of dashes
 - Both contain same popular domain name
- ✗ settings-yahoo.com ↔ facebook-support.org
 - Shared IP addresses
 - Same IP resolutions amount
 - Equal non-zero amount of dashes
 - Both contain popular domain name

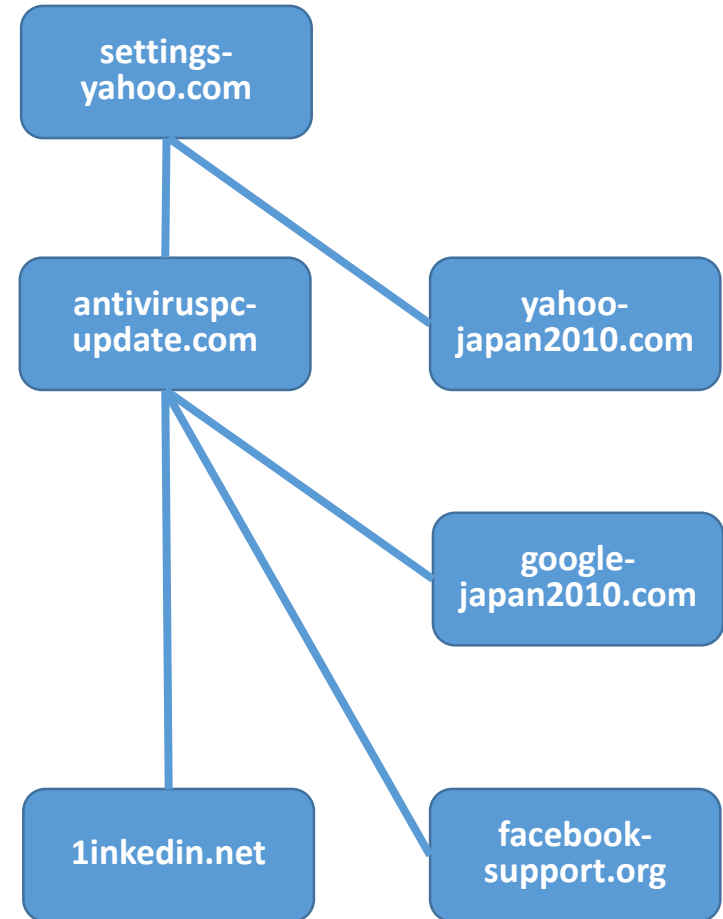

Phishing Actor

- ✓ • 1inkedin.net ↔ antiviruspc-update.com
 - Same anonymized registrant service provider
 - Close registration date
 - Shared IP addresses
- ✗ • 1inkedin.net ↔ google-japan2010.com
 - Same anonymized registrant service provider
 - Shared IP addresses
- ✗ • 1inkedin.net ↔ facebook-support.org
 - Shared IP addresses
 - Close registration date

Phishing Actor

- ✓ • antiviruspc-update.com ⇔ google-japan2010.com
 - Same anonymized registrant service provider
 - Equal non-zero amount of dashes
 - Shared IP addresses
- ✓ • antiviruspc-update.com ⇔ facebook-support.org
 - Close registration date
 - Same IP resolutions amount
 - Equal non-zero amount of dashes
 - Shared IP addresses

The graph is connected; therefore, all the domains are related

settings-yahoo.com	5 / 67

* Scanned on May-2016

There's Always Room For More BL

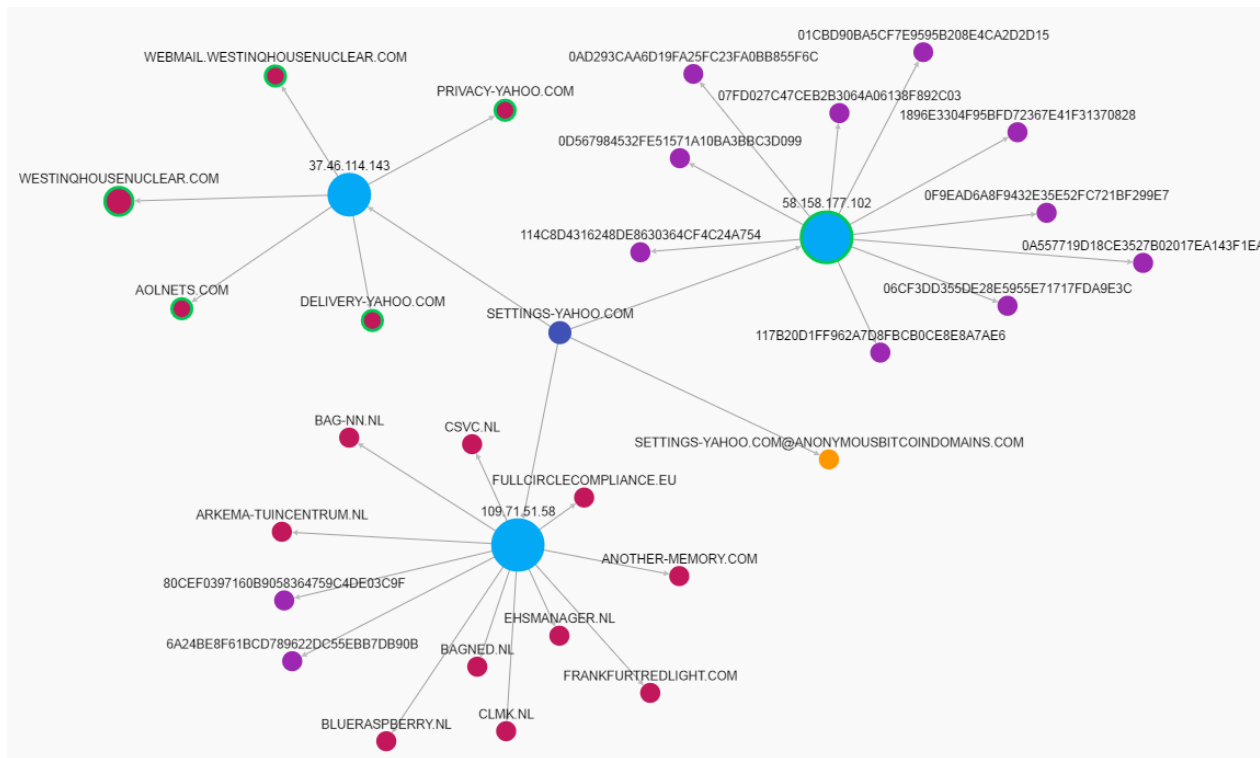

- There are many Threat Intelligence (TI) feeds out there
- The overlap between them is surprisingly low
- Putting all the vendors together still gives a partial coverage of the evilness on the internet

Source: *Data Driven Threat Intelligence: Metrics on Indicator Dissemination and Sharing*, MLSec/Niddel

IoC Similarity as a TI Feed

- The idea is to leverage existing feeds to create an in-house TI feed

Source: <https://www.threatcrowd.org/>

investigate-domain(domain)

If domain is suspicious, then:

For each domain's ip resolution, do:

`ip-investigation-queue.enqueue(ip)`

For each file downloaded/communicated with the domain:

`file-investigation-queue.enqueue(file)`

For each registrant owned the domain:

`registrant-investigation-queue.enqueue(registrant)`

In-House Feed Value

- Feed relevancy is crucial
- High hit rate of harvested indicators comparing to common TI feeds
- Proactively get as many indicators as possible of the current actor attacking the network

Share TI For Your Own Interest

- Organizations on same geo/industry/size are likely to get the same kind of attacks
- Sharing indicators between them could be the key differentiator between **DETECT** vs. **PREVENT**
- Actively sharing communities should be everyone's interest

Threat Context

- Adding more IoC is great
- But more alerts are pointless if they are without the proper threat context

All Maps News Images Videos More Search tools

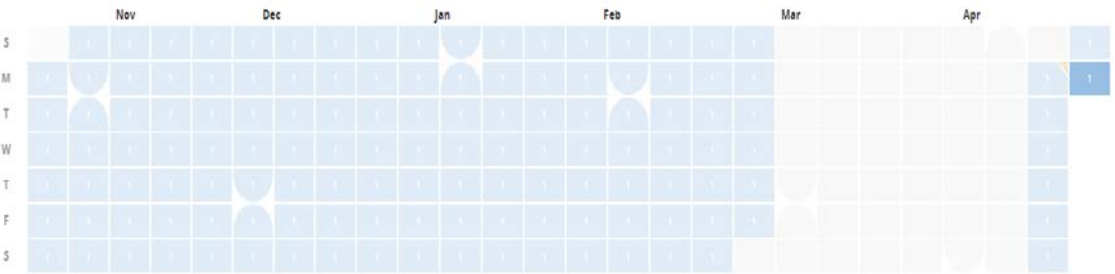

Your search - "kgpaorkwqlgrfcre.eu" - did not match any documents.

Suggestions:

- Make sure that all words are spelled correctly.
- Try different keywords.
- Try more general keywords.
- Try fewer keywords.

Domain Classification Analysis #1

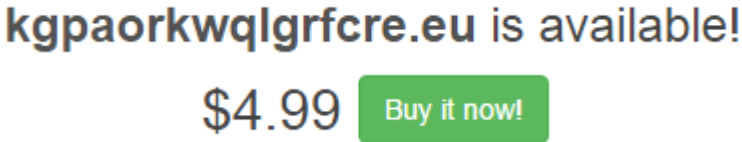

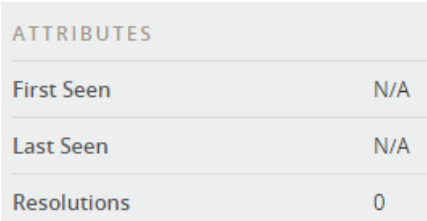

settings-yahoo.com

Evidence	Illustration
Domain Contained popular domain string (by Alexa)	<p>settings-<u>yahoo.com</u></p> <p>Global Rank [?] Rank in United States [?]</p> <p> 5  5</p>
Anonymized domain registrations (by who.is)	<p>Registrant Email: <code>whoisproxy@value-domain.com</code></p>
Website going up and down (by PassiveTotal)	

Verdict: Evidence implies a phishing /infecting website – Pre-Intrusion

Domain Classification Analysis #2

kgpaorkwqlgrfcre.eu

Evidence	Illustration								
Domain is available for registration (by who.is)									
Domain was never assigned to an IP (by PassiveTotal)	 <table border="1"><thead><tr><th colspan="2">ATTRIBUTES</th></tr></thead><tbody><tr><td>First Seen</td><td>N/A</td></tr><tr><td>Last Seen</td><td>N/A</td></tr><tr><td>Resolutions</td><td>0</td></tr></tbody></table>	ATTRIBUTES		First Seen	N/A	Last Seen	N/A	Resolutions	0
ATTRIBUTES									
First Seen	N/A								
Last Seen	N/A								
Resolutions	0								
Domain was seen with which many like him within several minutes	myjfqirgagnpboou.eu, pqxhqpvumylnikjh.eu, iddxbogywitoadv.eu, clgarxlbvxcraqht.eu, jjnstqfppyclvonk.eu, idlueqkbfkkclcdj.eu								

Verdict: Evidence implies a CnC server – Post Intrusion

Alerts Prioritization

- Host resolving a phishing/infecting domain indicates an infection attempt
- Host resolving a *CnC server* domain indicates an on-going infection

Staying a Step Ahead of Threats

Events to Incidents → Faster Remediation

In-House TI Feed → Faster Intrusion Containment

Sharing TI → Moving From **Detect To Prevent**
